

Hydraulic Winch Safety Mechanism Instructions

Introduction

RNRG Systems has begun providing an improved safety mechanism for use with the hydraulic winch. It is strongly recommended that you replace the original safety mechanism included with your winch with the one provided by RNRG. The improved safety mechanism helps prevent the winch from unexpectedly free spooling. Please note that the safety bar must be below the free spool lever at all times when the cable is attached to the tower system. These instructions will assist you in retrofitting your hydraulic winch to include the improved safety mechanism.

You will need a 3/16 inch Allen wrench (not included).

Step 1: Remove 2 Allen screws and the old safety mechanism as shown below.

Step 2: Attach the new safety mechanism and secure using the same screws.
